

INTERVIEW PREPARATION PLAN

Full-Stack Developer Interview Preparation Schedule

A Sustainable Daily, Weekly & 3-Month Roadmap for
Product-Company Interviews

Prepared for Nisha Yadav

STRUCTURED • SUSTAINABLE • INTERVIEW-READY

Working hours: 1:00 PM – 10:00 PM. Because of this, the goal is **not** to study 6–8 hours a day. For a strong product-company interview, a consistent **2.5–3.5 focused hours on workdays**, plus a deeper weekend session, is far more sustainable.

Learn → Code → Explain → Revise → Apply in Projects → Mock Interview

1. Your Daily Schedule (Monday – Friday)

Time	Activity	Duration
7:00 AM	Wake up + freshen up	—
7:30 – 8:00 AM	Exercise / walk / breakfast	30 min
8:00 – 9:00 AM	DSA / problem solving	1 hr
9:00 – 9:15 AM	Break	15 min
9:15 – 10:30 AM	Core technical preparation	1 hr 15 min
10:30 – 10:45 AM	Break	15 min
10:45 – 11:30 AM	Interview / project revision	45 min
11:30 AM – 12:30 PM	Lunch + get ready	1 hr
1:00 – 10:00 PM	Work	—
10:00 – 11:00 PM	Dinner + decompress	1 hr
11:00 – 11:30 PM	Light revision / speaking practice	30 min
11:30 PM – 7:00 AM	Sleep	7.5 hr

IMPORTANT — THE 11 PM SESSION

Don't turn this into another difficult study session. Use it for:

- Reviewing today's notes
- Revising flashcards
- Explaining a concept aloud
- Reading your interview questions
- Behavioral questions
- Reviewing mistakes from DSA

If you're exhausted after work, **skip this session and sleep. Sleep is part of your preparation.**

2. Weekly Schedule

Rather than studying every technology every day, give each day a primary focus.

Monday — JavaScript + DSA

8:00 – 9:00 — DSA

- Arrays
- Strings
- HashMap / Set
- Two pointers
- Sliding window
- Binary search

9:15 – 10:30 — JavaScript

- Scope
- Closures
- Hoisting
- this
- Prototype
- Event loop
- Promises
- Async/await
- ES6+
- Map/Set
- Generators
- Debouncing/throttling
- Memory management

10:45 – 11:30

Explain 2–3 JavaScript questions without looking at notes.

Tuesday — React + TypeScript + DSA

DSA

1 problem + review previous mistakes.

React

- Components
- Props/state
- Hooks
- useEffect
- useMemo
- useCallback
- Context
- React Router
- Forms
- Performance
- Error handling
- State management
- Component architecture

TypeScript

- Types/interfaces
- Generics
- Union/intersection
- Utility types
- Type narrowing
- unknown vs any

- Type-safe APIs

Wednesday — Node.js + Express + REST APIs

DSA

1 medium problem.

Backend

- Node.js architecture
- Event loop
- Streams
- Buffers
- Express
- Middleware
- Controllers
- Services
- Repository/data-access layer
- Error handling
- Validation
- REST API design
- HTTP methods/status codes
- Pagination
- Filtering
- Sorting
- Rate limiting
- Logging

Practical Task — Build One Small API Feature

- POST /api/users
- GET /api/users
- GET /api/users/:id
- PATCH /api/users/:id
- DELETE /api/users/:id

Thursday — MongoDB + Authentication + Angular/Vue

Rotate frontend frameworks instead of trying to study all three every week:

Week A — Angular

Week B — Vue

Week C — Angular

Week D — Vue

MongoDB / Mongoose

- Schema
- Models
- CRUD
- Indexes
- Aggregation
- Population
- Transactions
- Query optimization
- Schema design

Authentication

- JWT
- Access/refresh tokens
- Cookies
- Sessions
- Password hashing
- RBAC

- Authorization
- CORS
- CSRF
- Security best practices

Friday — System Design + DevOps/Cloud

This should be your architecture day.

System Design — Start Simple

Then gradually learn:

- Scalability
- Caching
- Redis
- Load balancing
- Database indexing
- Replication
- Sharding
- Queues
- Message brokers
- CDN
- Object storage
- Microservices
- Rate limiting
- Observability

DevOps — Rotate

AWS Fundamentals

3. Saturday — Deep Practice Day

Saturday should be your high-value practical day.

Morning

9:00 – 10:30 — DSA (2–3 problems)

1 easy

1 medium

Occasionally 1 difficult

10:45 – 12:15 — Full-Stack Project

Work on one serious project, for example:

Add:

- Authentication
- Authorization
- Validation
- Error handling
- Logging
- Testing
- Docker
- CI/CD
- Deployment

Afternoon

Take a break.

Evening (1.5 – 2 hours) — System Design / Architecture

Pick one system:

- URL shortener
- E-commerce
- Chat application
- Food delivery
- Ride booking
- Notification system
- File upload system
- Social media feed

Practice explaining:

4. Sunday — Revision + Mock Interview

Sunday should **not** become another 8-hour study day.

Morning

9:00 – 10:00 — Weekly DSA Revision

Redo problems you previously struggled with.

10:15 – 11:30 — Technical Revision

Ask yourself: *"Can I explain this without looking at my notes?"*

11:30 – 12:00 — Resume / Project Questions

For every project, prepare answers to:

- What problem does it solve?
- What was your responsibility?
- Why did you choose this architecture?
- Why this technology?
- Biggest challenge?
- Biggest production bug?
- How did you debug it?
- How did you improve performance?
- How did you handle security?
- How was it deployed?
- What would you improve?

Evening — Mock Interview

Month	Duration
Month 1	30–45 minutes
Month 2	45–60 minutes
Month 3	60–90 minutes

5. Three-Month Roadmap

Month 1 — Strong Fundamentals

Week 1

JavaScript

- Scope
- Hoisting
- Closures
- this
- Objects
- Prototypes

DSA

- Big O
- Arrays
- Strings

Week 2

JavaScript

- ES6+
- Destructuring
- Spread/rest
- Map/Set
- Functions
- Higher-order functions

DSA

- HashMap
- HashSet
- Two pointers

Week 3

JavaScript

- Promises
- Async/await
- Event loop
- Microtasks/macrotasks
- Callbacks

DSA

- Sliding window
- Stack
- Queue

Week 4

React + TypeScript

- Components
- Hooks
- State
- Props
- TypeScript fundamentals

DSA

- Binary search
- Recursion
- Sorting

MONTH 1 TARGET

Aim for approximately **25–35 DSA problems**. More importantly, understand the patterns instead of chasing problem count.

Month 2 — Full-Stack Depth

Week 5 — Node.js

- Event-driven architecture
- Event loop
- Express
- Middleware
- Error handling

Week 6 — REST APIs

- API design
- Validation
- Pagination
- Filtering
- Authentication
- Authorization

Week 7 — MongoDB

- Schema design
- Indexes
- Aggregation
- Mongoose
- Performance

Week 8 — Angular + Vue

Focus on:

- Architecture
- Components
- State management
- Routing
- Forms
- API integration
- Performance

Don't try to memorize every framework API. Focus on being able to answer: *"How would you build this feature?"*

MONTH 2 TARGET

Build or improve **one production-style full-stack project**.

Month 3 — Interview Mode

This month changes the preparation style. You should spend less time learning completely new topics and more time performing.

Week 9 — System Design

- API architecture
- Database design
- Caching
- Scalability
- Load balancing

Week 10 — AWS + DevOps

- Docker
- CI/CD
- AWS
- Deployment architecture

Week 11 — Interview Simulation

Every week:

- 2 DSA sessions
- 2 technical interviews
- 1 system design
- 1 behavioral session

Week 12 — Full Interview Simulation

Round	Focus
Round 1	DSA
Round 2	JavaScript / Frontend
Round 3	Backend
Round 4	System Design
Round 5	Project deep dive
Round 6	HR / Behavioral

6. Recommended Preparation Balance

Don't divide your time equally among all technologies. For a Full-Stack Developer targeting strong product companies, use approximately:

Area	Percentage
DSA / Problem Solving	25%
JavaScript + TypeScript	15%
React / Angular / Vue	15%
Node / Express / APIs	15%
System Design	10%
Projects / Architecture	8%
MongoDB / DB Concepts	5%
DevOps / AWS	4%
Behavioral / HR	3%

This is a much better approach than trying to study 15 technologies every day.

7. DSA Progression

Follow this order:

Difficulty Progression

Weeks	Progression
Weeks 1–2	Easy → Easy → Medium
Weeks 3–4	Easy → Medium → Medium
Weeks 5–8	Mostly Medium
Weeks 9–12	Medium + selected Hard

Don't immediately jump into Hard problems.

8. Your Revision System

THIS IS EXTREMELY IMPORTANT

Use a **1-3-7-14-30 revision cycle**. Suppose you learn JavaScript closures today — review it on the following schedule:

Day	Action
Day 1	Learn
Day 3	Quick review
Day 7	Explain from memory
Day 14	Solve related question
Day 30	Interview simulation

Topic Template

For every topic, maintain the following chain:

Example — Closure

- What is it?
- Why is it useful?
- How does it work?
- Real-world example?
- Common interview question?
- Can I code it?
- Can I explain it in 2 minutes?

9. DSA Mistake Notebook

Don't only maintain a list of solved problems — create a **DSA Mistake Log**:

Problem	Pattern	Mistake	Correct Approach
Two Sum	HashMap	Nested loop	Store complements
Sliding Window	Window	Wrong condition	Maintain invariant
Binary Search	Binary Search	Boundary error	Define search range

EVERY SUNDAY

Review this list. **Your mistakes are more valuable than your solved-problem count.**

10. Full-Stack Project Preparation

You should have **one project** that you know extremely deeply. Be prepared to draw its architecture:

You should be able to explain every box — and especially: **"Why did you choose it?"** That question is often more important than *"What technology did you use?"*

11. Mock Interview Strategy

Month	Frequency	Focus / Example
Month 1	1 mock/week	Focus on communication
Month 2	2 mocks/week	Wednesday → Technical Sunday → DSA/System Design
Month 3	3 mocks/week	Tuesday → DSA Thursday → Technical Sunday → Full interview

After Every Mock — Record

- Question: _____
- My answer: _____
- What I knew: _____
- What I missed: _____
- Better answer: _____
- Confidence: ____ / 10 Communication: ____ / 10

12. Behavioral Preparation

Don't leave HR preparation until the end. Prepare stories using the **STAR** method:

S — Situation

T — Task

A — Action

R — Result

Prepare at Least These

- Tell me about yourself.
- Explain your current project.
- Biggest technical challenge.
- Difficult production bug.
- Conflict with teammate.
- Tight deadline.
- Technical decision you disagreed with.
- Failure/mistake.
- Leadership example.
- Performance improvement.
- Why are you changing jobs?
- Why this company?
- Why should we hire you?
- Where do you see yourself in 3–5 years?

13. Daily Progress Tracker

Keep it very simple.

DATE: _____

- ☐ DSA
- ☐ Core concept
- ☐ Coding practice
- ☐ Project
- ☐ Revision
- ☐ Interview speaking

DSA Problems: ____

Study Time: ____

Revision Done: Yes / No

Today's strongest topic: _____

Today's weakness: _____

Tomorrow's priority: _____

Weekly Score

Give yourself a score out of 10:

Category	Score
DSA	___ / 10
JavaScript	___ / 10
Frontend	___ / 10
Backend	___ / 10
System Design	___ / 10
Projects	___ / 10
Communication	___ / 10
Consistency	___ / 10

Don't try to get 10/10 every week. **Your goal is steady improvement.**

14. Your Minimum-Day Rule

This will help you avoid burnout. Some days you will come home exhausted. Instead of saying "*I couldn't study today,*" use a minimum commitment:

Bad Day

20 min DSA + 10 min revision.

That's enough.

Normal Day

1 hr DSA + 1–1.5 hr technical + 30 min revision.

High-Energy Day

1 hr DSA + 1.5 hr technical + 1 hr project/system design + 30 min revision.

This prevents the all-or-nothing cycle.

15. The Most Important Rule for Your Preparation

Because you have experience with Angular, Vue, React, Node.js and full-stack development, **don't prepare like a beginner**. Your goal should be:

- 1 **Know** — "What is it?"
- 2 **Understand** — "How does it work?"
- 3 **Implement** — "Can I code it?"
- 4 **Apply** — "Where would I use it?"
- 5 **Defend** — "Why did you choose this approach instead of another?"

For product-company interviews, **Level 4 and Level 5** are where you should spend increasingly more time.

Your Overall 3-Month Strategy

The Target — By the End of 3 Months

- ☐ 80–120 well-understood DSA problems
- ☐ Strong JavaScript fundamentals
- ☐ Interview-ready React
- ☐ Interview-ready Angular
- ☐ Interview-ready Vue
- ☐ Strong Node/Express
- ☐ Strong REST API design
- ☐ MongoDB/Mongoose fundamentals + optimization
- ☐ Authentication/authorization understanding
- ☐ TypeScript confidence
- ☐ Docker + CI/CD fundamentals
- ☐ AWS fundamentals
- ☐ 8–12 system-design exercises
- ☐ 1 deeply understood full-stack project
- ☐ 15–25 mock interviews
- ☐ Strong resume/project explanations
- ☐ A prepared set of behavioral answers

Most importantly, don't try to finish everything before starting interviews.

Start interviewing once you reach a reasonable baseline and use real interviews to identify gaps.

If you follow this consistently for three months, you'll be preparing not just to answer interview questions — but to **think and communicate like a strong Full-Stack Engineer**.
